FAQ

Welcome to the Trac Open Source Project.

Trac is an enhanced wiki and issue tracking system for software development projects. Trac uses a minimalistic approach to web-based software project management. Our mission is to help developers write great software while staying out of the way. Trac should impose as little as possible on a team's established development process and policies.

It provides an interface to Subversion and Git (or other version control systems), an integrated Wiki and convenient reporting facilities.

Trac allows wiki markup in issue descriptions and commit messages, creating links and seamless references between bugs, tasks, changesets, files and wiki pages. A timeline shows all current and past project events in order, making the acquisition of an overview of the project and tracking progress very easy. The roadmap shows the road ahead, listing the upcoming milestones.

Try out our demos!

Redmine

History

Redmine is a flexible project management web application. Written using the Ruby on Rails framework, it is cross-platform and cross-database.

Redmine is open source and released under the terms of the GNU General Public License v2 (GPL).

Features

Some of the main features of Redmine are:

- Multiple projects support
- Flexible role based access control
- Flexible issue tracking system
- Gantt chart and calendar
- News, documents & files management
- Feeds & email notifications
- Per project wiki
- Per project forums
- Time tracking
- Custom fields for issues, time-entries, projects and users
- SCM integration (SVN, CVS, Git, Mercurial, Bazaar and Darcs)
- Issue creation via email
- Multiple LDAP authentication support
- User self-registration support
- Multilanguage support
- Multiple databases support

Read more about Redmine features.

Documentation

You can read the Redmine guide.

zmq_ctx_term hangs with PGM #822

New issue

Open **xdmiodz** opened this issue on Jan 14, 2014 · 5 comments

xdmiodz commented on Jan 14, 2014

Hi,

This small program hangs ZMQ:

```
#include <zmq.h>
#include <assert.h>

int main()
{
  void *context = zmq_ctx_new ();
  void *socket = zmq_socket (context, ZMQ_SUB);
  int linger = 0;
  zmq_setsockopt(socket, ZMQ_LINGER, &linger, sizeof(linger));
  int rc = zmq_bind (socket, "pgm://239.192.1.1:9998");
  assert (rc == 0);

  printf("Termination...\n");
  zmq_close(socket);
  zmq_ctx_destroy (context);
  return 0;
}
```

Jack, i think you did the original custom field stuff so wanted to run this by you.

Reply

Sindhu Reddy Feb 10 at 11:09 AM

This doesn't seem to be used anywhere else.

1: FroggerMVC/FogBugzMVC/Content/cases/fields/custom.js

Reply

Milton Richie Feb 10 at 11:14 AM

Just name the parameter differently.

1: FroggerMVC/FogBugzMVC/Content/cases/fields/custom.js

Milton Richie Feb 10 at 11:19 AM

1) I don't think we usually store js functions in variables unless there's some reason. This is a pure function.

2) It's really short, you probably just want to inline it. It didn't confuse me less this way.

README.md

ZeroMQ

build passing

Welcome

The 0MQ lightweight messaging kernel is a library which extends the standard socket interfaces with features traditionally provided by specialised messaging middleware products. 0MQ sockets provide an abstraction of asynchronous message queues, multiple messaging patterns, message filtering (subscriptions), seamless access to multiple transport protocols and more.

Building and installation

See the INSTALL file included with the distribution.

Resources

Extensive documentation is provided with the distribution. Refer to doc/zmq.html, or "man zmq" after you have installed 0MQ on your system.

Website: http://www.zeromq.org/

Development mailing list: zeromq-dev@lists.zeromq.org Announcements mailing list: zeromq-announce@lists.zeromq.org

Git repository: http://github.com/zeromq/libzmq

0MQ developers can also be found on the IRC channel #zeromq, on the Freenode network (irc.freenode.net).

Quick Start

Add or upload files directly via Kallithea

Add New File

Push new repo

```
hg clone http://accu@localhost:5000/libzmq
hg add README # add first file
hg commit -m "Initial" # commit with message
hg push  # push changes back
```

Existing repository?

```
hg push http://accu@localhost:5000/libzmq
```

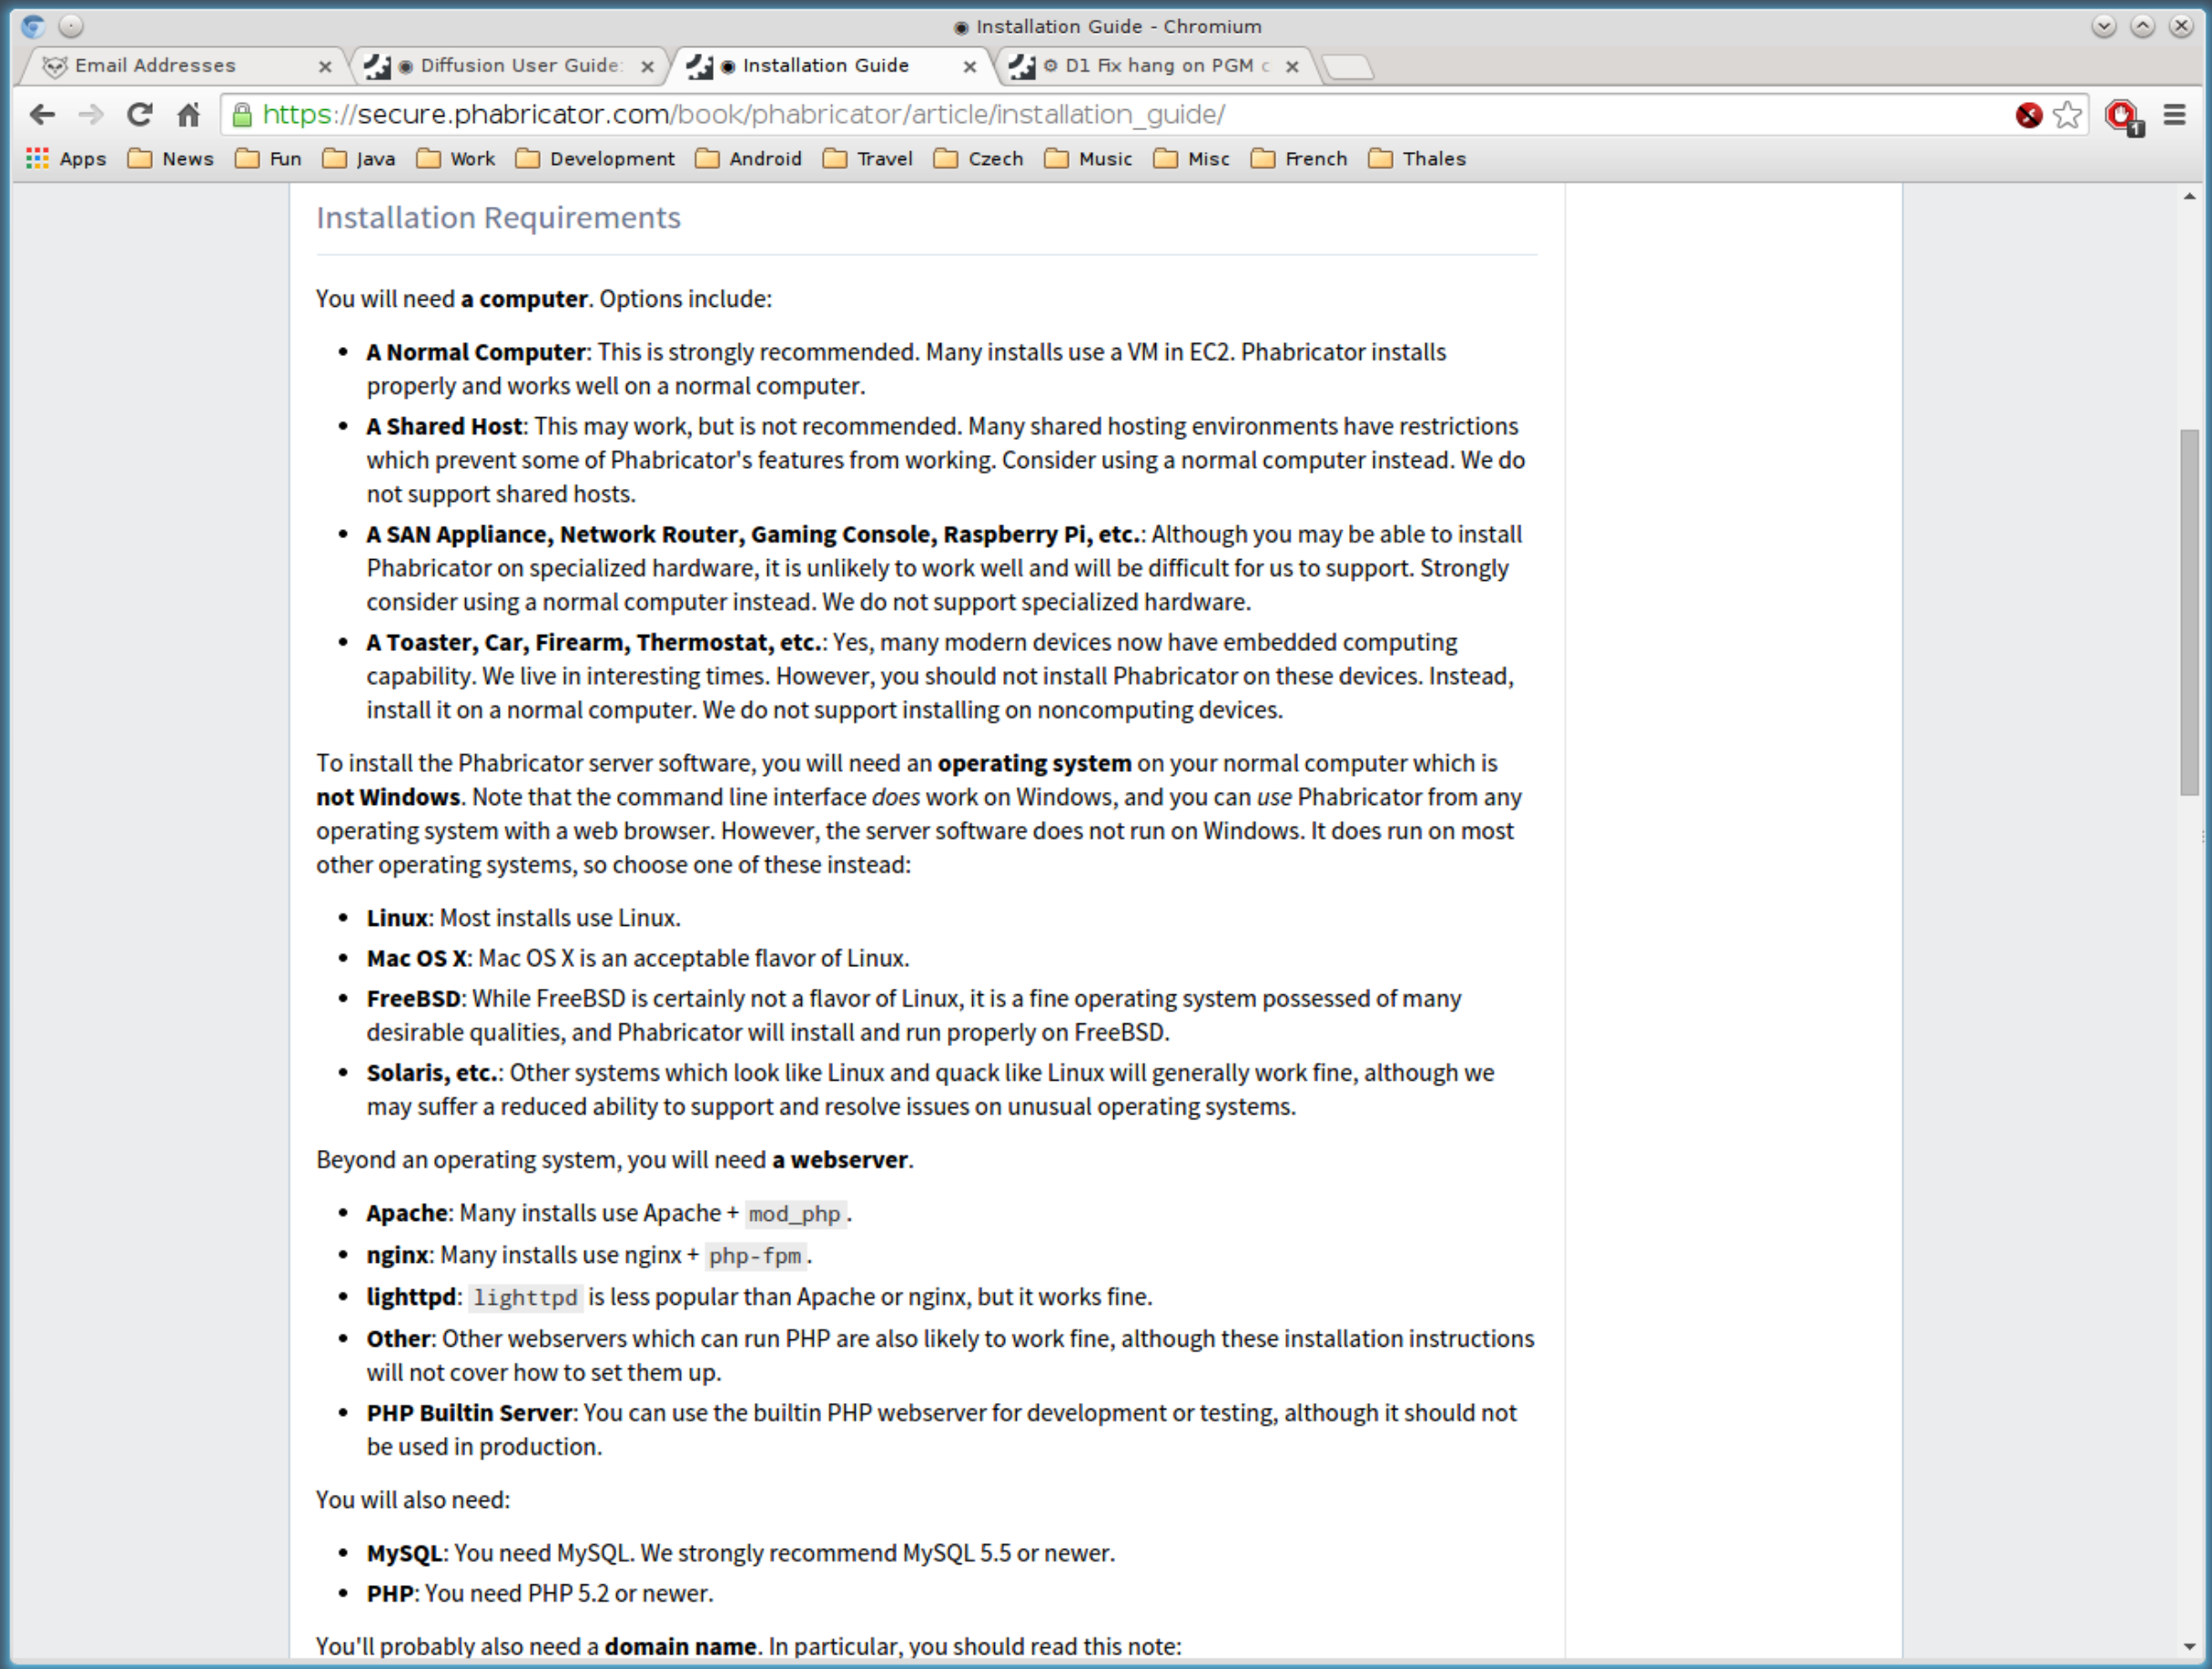
PHABRICATOR

- www.phabricator.org
- "Written in PHP so literally anyone can contribute, even if they have no idea how to program."
- Self-hosted, mirror on GitHub.
- Apache 2.0

PHABRICATOR FEATURES

- Repository management - Mercurial, Git, Subversion
- Code reviews
- Issue tracker
- Wikis
- Design review
- Messaging
- ... and more coming.



Installation Requirements

You will need **a computer**. Options include:

- **A Normal Computer**: This is strongly recommended. Many installs use a VM in EC2. Phabricator installs properly and works well on a normal computer.
- **A Shared Host**: This may work, but is not recommended. Many shared hosting environments have restrictions which prevent some of Phabricator's features from working. Consider using a normal computer instead. We do not support shared hosts.
- **A SAN Appliance, Network Router, Gaming Console, Raspberry Pi, etc.**: Although you may be able to install Phabricator on specialized hardware, it is unlikely to work well and will be difficult for us to support. Strongly consider using a normal computer instead. We do not support specialized hardware.
- **A Toaster, Car, Firearm, Thermostat, etc.**: Yes, many modern devices now have embedded computing capability. We live in interesting times. However, you should not install Phabricator on these devices. Instead, install it on a normal computer. We do not support installing on noncomputing devices.

To install the Phabricator server software, you will need an **operating system** on your normal computer which is **not Windows**. Note that the command line interface *does* work on Windows, and you can *use* Phabricator from any operating system with a web browser. However, the server software does not run on Windows. It does run on most other operating systems, so choose one of these instead:

- **Linux**: Most installs use Linux.
- **Mac OS X**: Mac OS X is an acceptable flavor of Linux.
- **FreeBSD**: While FreeBSD is certainly not a flavor of Linux, it is a fine operating system possessed of many desirable qualities, and Phabricator will install and run properly on FreeBSD.
- **Solaris, etc.**: Other systems which look like Linux and quack like Linux will generally work fine, although we may suffer a reduced ability to support and resolve issues on unusual operating systems.

Beyond an operating system, you will need **a webserver**.

- **Apache**: Many installs use Apache + `mod_php`.
- **nginx**: Many installs use nginx + `php-fpm`.
- **lighttpd**: `lighttpd` is less popular than Apache or nginx, but it works fine.
- **Other**: Other webservers which can run PHP are also likely to work fine, although these installation instructions will not cover how to set them up.
- **PHP Builtin Server**: You can use the builtin PHP webserver for development or testing, although it should not be used in production.

You will also need:

- **MySQL**: You need MySQL. We strongly recommend MySQL 5.5 or newer.
- **PHP**: You need PHP 5.2 or newer.

You'll probably also need a **domain name**. In particular, you should read this note:

Repository Name and Location

Choose a human-readable name for this repository, like "CompanyName Mobile App" or "CompanyName Backend Server". You can change this later.

Name: libzmq

Human-readable repository name.

Choose a "Callsign" for the repository. This is a short, unique string which identifies commits elsewhere in Phabricator. For example, you might use `M` for your mobile app repository and `B` for your backend repository.

Callsigns must be UPPERCASE, and can not be edited after the repository is created. Generally, you should choose short callsigns.

Callsign: LIBZMQ

Short UPPERCASE identifier.
