Best practices when accessing Big Data ... or any other data!

Dr Rosemary Francis CEO Ellexus: The I/O profiling company

In this talk I will explore best practices when accessing data on local or shared file systems. I will use examples of what can go wrong taken from real customer problems to back up how simple guidelines and good use of available tools can make a massive difference to the performance, reliability, scalability and portability of your code. There are free and commercial tools that can help, but they need to be combined with good coding and good working practices. Data doesn't have to be big to cause a problem, but as data sets grow, the way we access data has never been a more important consideration. Our customers work in scientific and high-performance computing with different trade-offs to make between time-to-market, reliability and performance, but what they all have in common is that they have to care about I/O.

Ellexus Ltd: The I/O Profiling Company

diamond

DELLEMC

Products: We make tools to help you

- improve application performance,
- protect shared storage, and
- manage application dependencies.

Customers include:

TACC TEXAS

wellcome

ger

ANSYS OLD SYDOPSYS

Ellexus enterprise products Take control of the way you access your data

Detailed I/O profiling Application discovery

Dependencies

What do I need to include in my container?

I/O profiling What resources do I need to run it?

Debug and triage Why am I not getting the results I expect?

Ellexus enterprise products Take control of the way you access your data

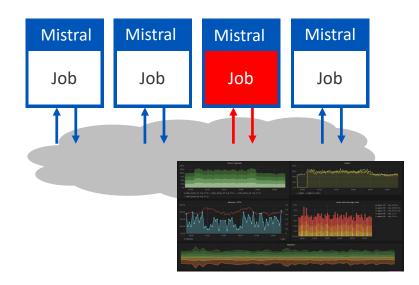

Protect storage from rogue jobs

Find bottlenecks in production

Chargeback and procurement

Live system telemetry: I/O monitoring in production

Why profile I/O

Detect dependencies for containerization and migration

Application correctness in delivery and deployment

Understand resources for sizing and procurement of IT resources or cloud

Profile I/O for tuning and optimization

Monitor I/O for chargeback and troubleshooting in the field

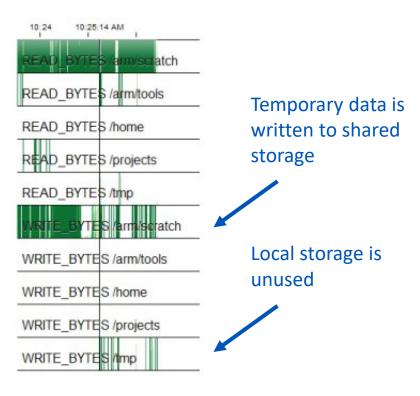

The noisy neighbour problem Bad performance case study

A small number of jobs can overload shared file systems and cause system bottlenecks.

This software build is overloading shared storage by putting data in the wrong place.

Example of a rogue job from Arm:

Fast, agile and (hybrid) cloud ready

Fast, agile and (hybrid) cloud ready

Performance, portability and planning

Fast, agile and (hybrid) cloud ready Performance, portability and planning

Performance: Understand I/O patterns and requirements

Portability: Understanding application dependencies

Planning: System telemetry and monitoring

Where does bad I/O come from?

Third party tools and libraries

Legacy code

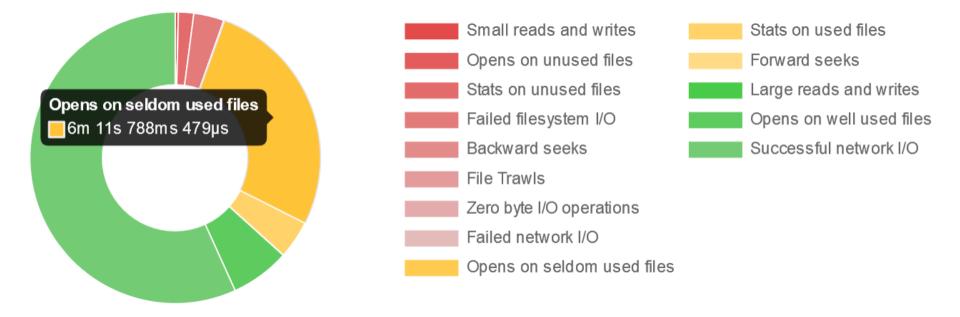

Misunderstandings about IT infrastructure

Changes in your working environment

and occasionally... Bad code and lazy design

How much time are you wasting doing bad I/O?

Small reads and writes are bad for everyone

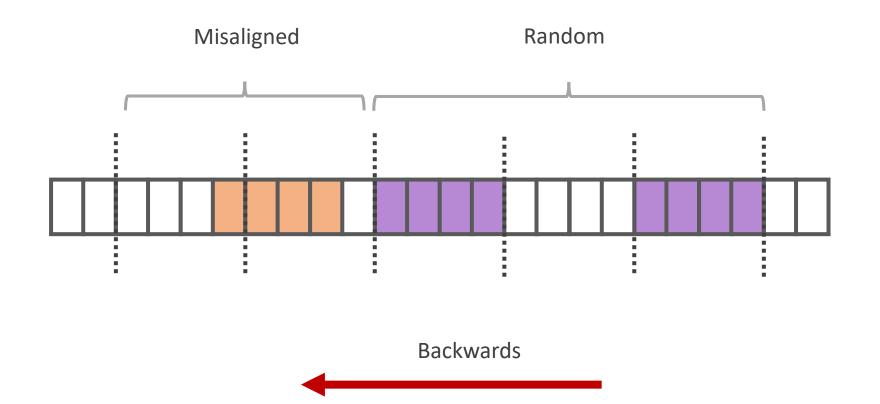

Libraries may not buffer I/O well

OS may not buffer I/O well

Every read to a shared file system is a write

Application Library Calls Spectre and Meltdown! Library System Calls User space Kernel space OS Disk or Network I/O Filesystem

Misaligned and random I/O

Housekeeping and deletes

Delete as you go along – don't delete everything at the end.

Failed I/O and file system trawls

Looking for a file? Don't stat everything to find it

PATH variables

ightarrow Zero tolerance on bad I/O

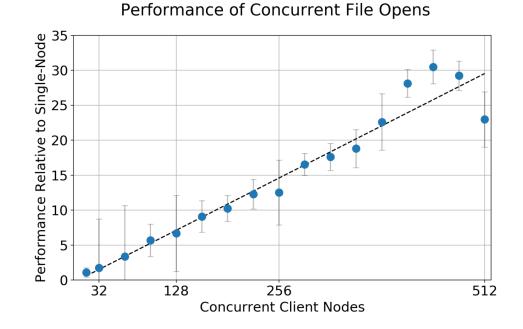

Opens and closes

Open loops!

```
for(...) {
            open()
            write()
            close()
}
```

One customer crashed Lustre doing this

Another got a 700% speed up when they fixed the loop!

Time taken to open a file across a large number of compute nodes

Tuning cancer pipelines at the Sanger Institute

The Pancancer project: 2000 whole genomes at multiple HPC sites

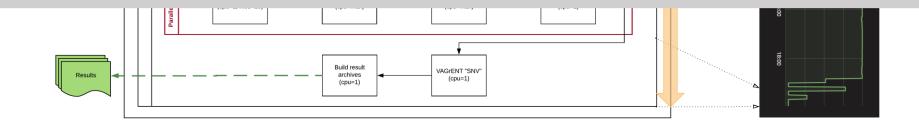

- \rightarrow Containerised pipelines for portability
- \rightarrow I/O tuned with Ellexus tools
- \rightarrow Storage now needs to be sized correctly

Tuning cancer pipelines at the Sanger Institute

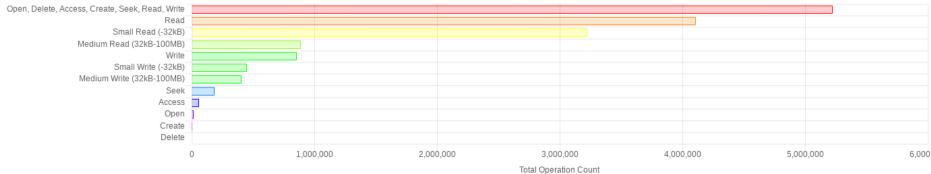

Runtime was reduced from 32hr to 18hr through profiling I/O and tuning deployment

Profiling the cancer pipeline AWS m5.xlarge 4vCPU 16GB

Number of I/O operations() by type

Storage comparison

	Time*		Cost per m	onth
GP2	52m 23s	100%	174.11	100%
Magnetic EBS	1h 01m 44s	118%	174.43	100%
Provisioned 100 IOPS	1h 42m 01s	195%	184.61	106%
Throughput optimised HDD	1h 19m 32s	152%	189.01	109%
150GB NVMe	51m 27s	98%	191.79	110%
Provisioned 500 IOPS	54m 22s	104%	215.01	123%

 \Rightarrow The Provisioned IOPS SSDs performed very badly

 \Rightarrow AWS default option, GP2 is the best \Rightarrow NVMe was only 2% faster for a 10% price increase

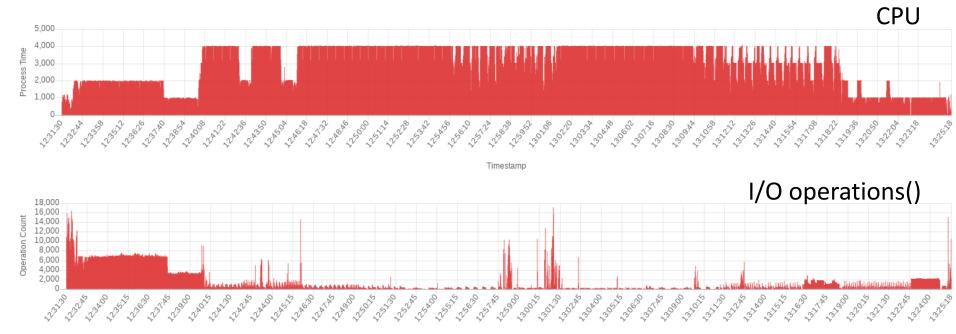

I/O Operations() over time

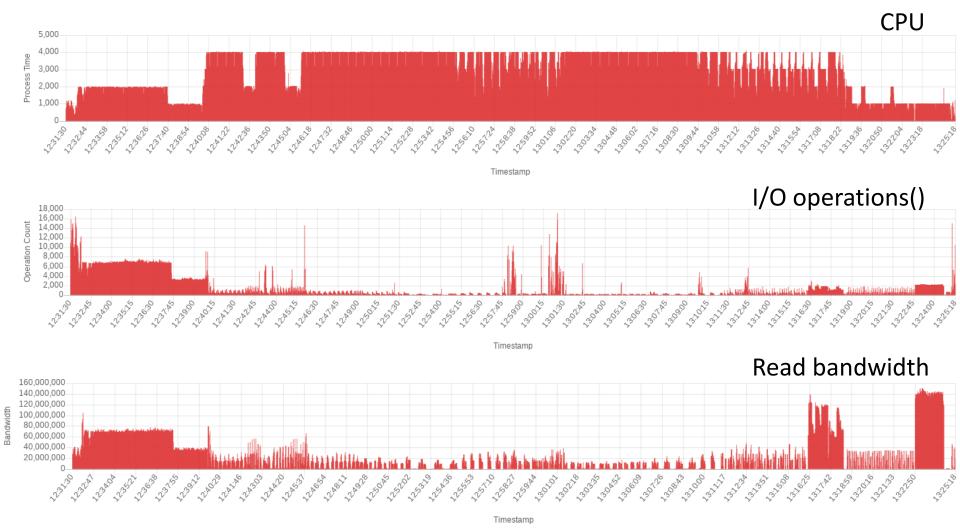

CPU and I/O Profile (on GP2 SSD)

Timestamp

CPU and I/O Profile (on GP2 SSD)

More CPU and less memory: m5.xlarge vs c5.xlarge (still on GP2 SSD default storage)

M5.xlarge	c5.xlarge
4 vCPU	4 vCPU
16GB	8GB
Runtime: 53min	Runtime: 44min
<u>Cost: \$0.21</u>	<u>Cost: \$0.16</u>

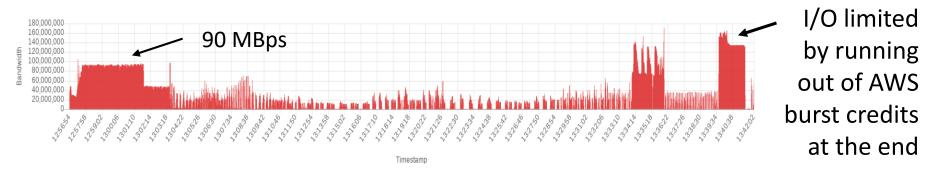

Read bandwidth: m5.xlarge vs c5.xlarge

Read bandwidth for mx.large 16GB

Read bandwidth for cx.large 8GB

How long did this work take?

Tuning the pipeline took a lot of effort ... but runtime went from 32hr to 18hr

Sizing the storage and compute correctly took three days

... and we saved >10% of cloud costs for the project

"Improving run time often doesn't require extensive rewrites. Knowing where to look is key."

Keiran Raine, Cancer researcher, Sanger Institute

Lessons learnt

 \Rightarrow Containers make it easy to deploy applications

 \Rightarrow Optimising I/O can save you money

 \Rightarrow Need to understand all variables to find bottlenecks:

- \Rightarrow CPU
- \Rightarrow memory
- \Rightarrow I/O patterns
- \Rightarrow I/O performance

Ellexus best practices for good I/O

Dependencies as the number one check

- Wrong libraries
- Wrong config files
- Changes need to be checked by a human

Regression testing for I/O behaviour

Zero tolerance on bad I/O

Test in production - Often problems are in set up scripts

Tuning and optimisation - if you have time

Free and open source I/O tools

Strace

- System call tracing

Darshan

- For MPI I/O profiling

iotop

- Like top, but for disk I/O

XALT

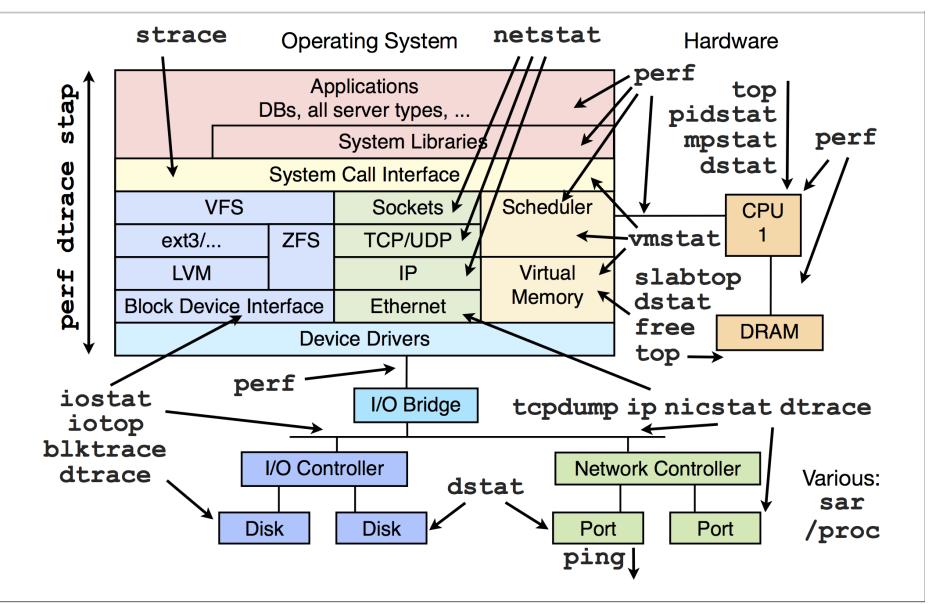

- Basic dependency tracking on distributed systems

Perf

- Low level I/O information

Brendan Gregg's guide to free and open source I/O tools

Contact us!

Our tools are trusted by research organisations, financial institutions, semiconductor companies and software vendors around the globe.

- Take control of your I/O on-premise and in the cloud
- Whole-system monitoring with APM solutions
- Detailed dependency analysis and bottleneck resolution

Proven to improve performance, increase up time and keep your customers happy.
