Coderetreats are free day-long, intensive practice events, focusing on the fundamentals of software development and design. By providing developers the opportunity to take part in focused practice, away from the pressures of "getting things done", the coderetreat format has proven itself to be a highly effective means of learning and nurturing software development skills.

All over the world, people are coming together in small communities of practices to learn, explore and grow. Join us on the **Global Day of Coderetreat** or discover local communities around you!

## Taking Baby Steps

Posted by [Adi Bolboaca](#) on Mar 11, 2013

I wrote a post on the history of *Taking Baby Steps*, you can read it [here](#).

Now I would like to tell you more about the workshop and the technique itself. While coding, for me it is very important to be focused on one idea. Why? Because this is how *programmer mistakes* appear in the code; some people tell them *bugs*. The other thing I am interested in is to have an undo button for every change. This is why I want to commit every 1-2 minutes.

The rules are the following:

### Steps

1. Setup source control repository.
2. Setup a timer for 2 minutes interval when you start.
3. Write exactly one test
  1. If the **timer rings** and the **test is red** then **revert** and **start over**.
  2. If the **test is green** before timer rings then **commit**.

The new style versus test-driven development

As part of Limbo on the Cheap, we invented a new programming workflow. I introduced “test && commit”, where every time the tests run correctly the code is committed. Oddmund Strømme, the first programmer I’ve found as
